PROJECT REPORT

DIGITAL LITERACY

NAME – R.V. KASHIKA

REG NO. – 25BOE10047

BRANCH – BIOENGINEERING

COURSE CODE – CSE0001

COURSE TITLE – DIGITAL LITERACY

DATE – 30.03.2026

INTRODUCTION

My work for this project centred on developing the digital literacy skills that are vital in our tech-heavy world. The goal was to show how to use digital tools effectively while staying safe and professional online, while also explaining the difference between being digitally active and digitally literate. Across five different tasks—ranging from designing infographics and portfolios to exploring new platforms and professional communication—I got to work directly with tools used throughout academia and business. This project helped me refine how I present information and helped me understand what exactly it takes to be digitally literate, and areas I can improve on.

TASK 1

For creating my Digital Literacy infographic, I used Canva because I have used it before and I am familiar with its user interface. It provides a wide range of templates and allows one to customise everything, ranging from the icons to the text and even edit the pictures. My design is an infographic which briefly explains the topic of what digital literacy is, the types of digital learning tools prevalent in today's world and essential digital practices to keep oneself safe. I have kept it simple by using just key points along with examples to make it easier to understand, with relevant icons to make it visually appealing as well.

What I found interesting was the varied options presented to me, and this made the creative process very fun as well. The challenge I faced was trying to keep everything concise, but also providing all the required information with icons to match the points. This task helped me understand how to work with digital tools to present an infographic, which will be helpful since this skill is required to make engaging presentations in any domain.

TASK 2

For my digital portfolio, I chose LinkedIn, Kaggle and GitHub because they're widely used in academia and in professional settings. LinkedIn is used to form a network between like-minded industry professionals, which helps in collaboration and even in getting opportunities. GitHub is a web-based platform that uses Git, an opensource version control system, to help individuals and teams store, manage, track, and collaborate on software development projects. Kaggle is primarily used for hosting data

science competitions, sharing datasets, collaborating with other professionals, and learning new AI techniques. These platforms will help in creating a strong portfolio and resume for me, which will not only help in getting better opportunities but will also allow me to grow professionally so I will definitely continue using them in the near future as well.

TASK 3

This task focuses on the usage of coding and collaborative platforms that are extremely important in today's world. On Hacker Rank, I solved 2 basic challenges, and I would like to continue using this platform for my coding practice because it's very useful to strengthen my basics before proceeding with complex coding. The Google Forms quiz is on Digital Literacy awareness, and this tool allows us to create a survey and collect data from people who are in different places. It also summarises all the responses and produces a statistical representation wherever possible, making it very easy to use.

TASK 4

Clear digital communication serves as a cornerstone of modern academic and professional life. Problems frequently occur when a student sends an informal or poorly structured email to a professor, which can create confusion or leave a lasting negative impression. Fortunately, such friction is easily avoided by practising good email etiquette—specifically through clear subject lines, a polite tone, and a coherent structure.

Through this exercise, I have come to appreciate the value of professional digital interactions. Using proper etiquette ensures that the core message is conveyed effectively while also reflecting a positive, responsible attitude. Ultimately, how we communicate online is a direct reflection of our personal brand and professionalism.

TASK 5

While reading about the case study and how it occurred, what surprised me the most was how for something that caused so much damage and loss, all the data needed to complete this attack was just a single VPN password. All this is because there was no multi-factor authentication enabled, which shows how security actually plays a vital role in our lives. One thing I would like to change is to enable 2-step authentication wherever possible so that I can protect my data and confidential information, like bank details, etc., from attackers.

CONCLUSION

This project highlighted the essential nature of digital literacy today. I gained practical experience in using digital tools, maintaining a professional online presence, and communicating ethically. I also developed a stronger understanding of cyber threats and safety protocols. Overall, this project was extremely beneficial, and these skills will be helpful for my future as well.
